## **FIRE STOPPING SYSTEMS**

---

### **PROMASEAL SWITCHBOX INTUMESCENT**

Compartment walls from a fire barrier between the compartments they separate. Often however, recessed switchboxes need to be installed in the fire rated dry wall structures. The recessed installations then jeopardise the fire barrier function of the compartment wall.

Standard switch boxes compromise the fire resistance of the walls. Promaseal switchbox intumescent provides the fire resistant performance to maintain the fire resistant of the compartment in which they are installed.

Delivered as pads in modules of 20mm \* 70mm \* 8mm thick
